

Note: You'll need to use the user/password that you used to install postgres for this portion.

Start PgAdmin4 and ensure the postgres server is 'running' (it generally will be by default after installation).

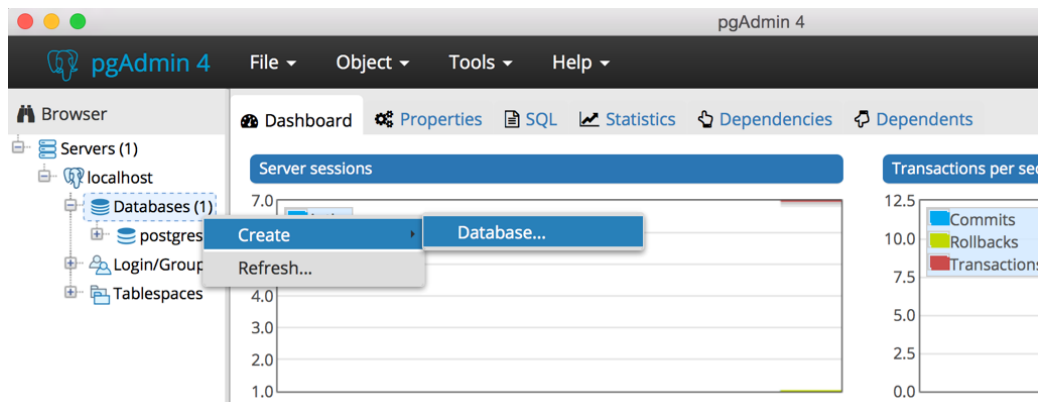

### Step 1: Add your computer to the list of connections

- Under the "General" tab, give the connection a name
- Then switch to the "Connection" tab to use the hostname: "localhost" and use your username and password to connect to the server.

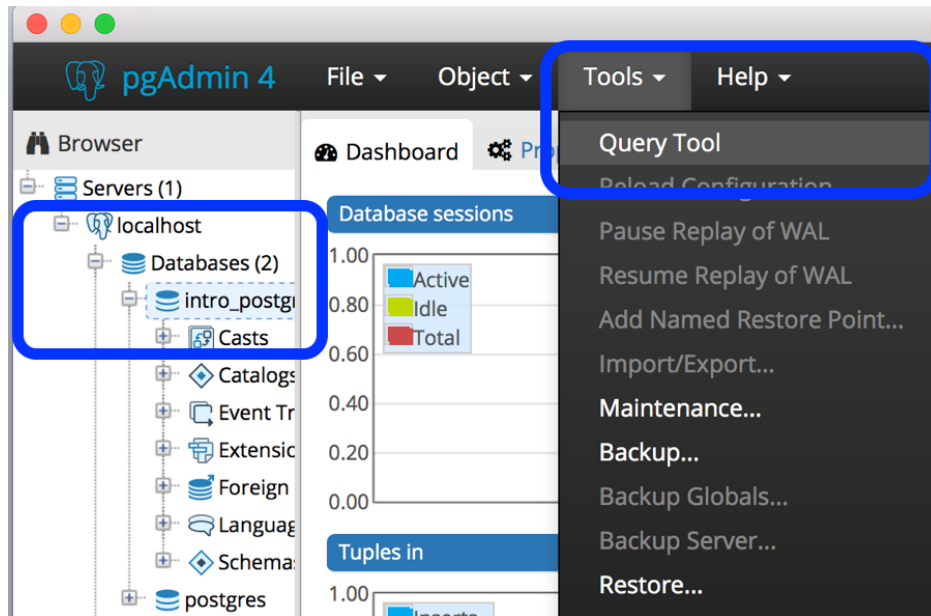

### Step 2: Add a database to be utilized for the class

- Expand the localhost server
- Right-click on 'Databases' and select 'Create -> Database...'

### Step 3: Start the "Query Tool"

- Click on the database to 'highlight' it
- Click on the "Tools" dropdown in PgAdmin
- Select 'Query Tool' from the drop down

**Step 4: Seed the database by copy pasting this entire file into the query tool and 'Execute'**

- Utilize this link to get the file: [https://github.com/Jess88/Introduction-to-PostgreSQL/blob/master/intro\\_to\\_postgres\\_setup.sql](https://github.com/Jess88/Introduction-to-PostgreSQL/blob/master/intro_to_postgres_setup.sql)
- Copy the entire file into the query tool and execute the command with F5 or the lightning bolt button.
